

Draft of April 30, 2021

**AUTHORIZATION TO DISCHARGE UNDER THE
OKLAHOMA POLLUTANT DISCHARGE ELIMINATION SYSTEM**

<p>Discharge Permit Number: OK0026018 Reclaimed Water Permit Number: RW20-013 Facility Id Number: S10823</p>

PART I

In compliance with the Oklahoma Pollutant Discharge Elimination System Act (OPDES) Act, Title 27A OS § 2-6-201 et seq., as amended, and the rules of the Oklahoma Department of Environmental Quality (DEQ) adopted thereunder (see the Oklahoma Administrative Code (OAC) 252:606, OAC 252:627, and OAC 252:656); the Federal Clean Water Act (CWA), Public Law 95-217 (33 USC 1251 et seq.), Section 402; and the National Pollutant Discharge Elimination (NPDES) regulations at Title 40 of the Code of Federal Regulations (CFR) Parts 122, 124, and 403),

Chickasha Municipal Authority
117 North 4th Street
Chickasha, OK 73018

is hereby authorized to discharge treated wastewater from a facility located at approximately

NW¹/₄, NW¹/₄, SW¹/₄
Section 35, Township 7 North, Range 7 West, IM,
Grady County, Oklahoma

to the receiving water: Washita River at the point located at approximately

Latitude: 35° 02' 11.180" N [GPS: NAD83]
Longitude: 97° 54' 29.402" W [GPS: NAD83]

Water Body ID No. OK310820010010_00

is also authorized to supply reclaimed water/treated wastewater for reuse from the above referenced facility

in accordance with effluent limitations, monitoring requirements and other conditions set forth in Parts I, II, III, and IV hereof.

This permit replaces and supersedes the previous permit issued on December 23, 2015.

The issuance date of this permit is **Month Date, Year**.

This permit shall become effective **Month Date, Year**.

This permit and authorization to discharge shall expire at midnight **Month Date, Year**.

For the Oklahoma Department of Environmental Quality:

Michael B. Moe, P.E., Manager
Municipal Discharge and Stormwater Permit Section
Water Quality Division

Shellie R. Chard, Director
Water Quality Division

A. Effluent Limitations and Monitoring Requirements (Outfall 001)

During the period beginning the effective date and lasting through the expiration date, the permittee is authorized to discharge treated wastewater in accordance with the following limitations:

Pollutants		Discharge Limitations				Monitoring Requirements	
		Mass Loading (lb/day)	Concentrations (mg/L unless otherwise specified)			Frequency	Sample Type
			Monthly Avg.	Monthly Avg.	Weekly Avg.		
Flow (mgd) [50050]	Year round	---	Report	---	Report	Daily	Totalized
Carbonaceous Biochemical Oxygen Demand, 5-Day (CBOD ₅) [80082]	Jun – Oct	499.1	13.3	19.95	---	1 per week	24-hour composite ^a
Biochemical Oxygen Demand, 5-Day (BOD ₅) [00310]	Nov – May	750.6	20	30	---	1 per week	24-hour composite ^a
Total Suspended Solids (TSS) [00530]	Year round	1126.0	30	45	---	1 per week	24-hour composite ^a
Dissolved Oxygen (DO) [00300]	Year round	---	4.0 Minimum			Daily	Grab
Ammonia as N (NH ₃ -N) [00610]	Jun – Oct	251.5	6.7	10.05	---	1 per week	24-hour composite ^a
	Nov – May	300.2	8.0	12.0	---		
<i>E. coli</i> ^b [51040]	May – Sep	---	126 ^b	---	406	3 per week ^c	Grab
Total Residual Chlorine (TRC) [50060]	Year round	---	Instantaneous Maximum: No Measurable ^{d, e}			Daily	Grab
pH (standard unit) [00400]	Year round	---	6.5 – 9.0			Daily	Grab

^a Table 1-3 in Appendix A of OAC 252:606 specifies 6-hour composite samples for CBOD₅/BOD₅, TSS, and ammonia. However, the permittee requested for 24-hour composite samples to enable use of a single auto-sampler.

^b *E. coli* shall be reported as most-probable number (MPN)/100 mL, monthly average of *E. coli* is in geometric mean.

^c If the permittee does not supply reclaimed water during an entire week, the permittee may analyze only two samples for *E. coli* during that week with a comment on the DMR form “No reclaimed water supplied during the week of mmddy.”

^d No measurable is defined as less than 0.1 mg/L.

^e If no chlorine is used for an entire reporting period, the permittee shall report a value of “zero” for the daily maximum and enter “No chlorine used this reporting period” in the comments section on the DMR for that reporting period in lieu of the indicated testing. For any week in which chlorine is used, the indicated testing shall be done until the chlorine is no longer in use and at least one subsequent test verifies that the effluent meets the total residual chlorine limit.

Sampling Locations

Samples taken for compliance with the monitoring requirements specified above shall be taken at the auto-sampler for composite samples and at the manhole near auto-sampler for grab samples (except for TRC). Samples taken for compliance with the fecal coliform and TRC monitoring requirements specified above shall be taken at the Parshall flume.

Other Year Round Requirements

- There shall be no discharge of floating solids or visible foam in the water other than trace amounts.
- There shall be no discharge of a visible sheen of oil or globules of oil or grease on or in the water. Oil and grease shall not be present in quantities that adhere to stream banks and coat bottoms of water courses or which cause deleterious effects to the biota.
- All monitoring and reporting requirements shall also be in compliance with Part III of this permit.

B. Whole Effluent Toxicity Reporting and Monitoring Requirements

1. Acute WET Test (Outfall TX1)

During the period beginning the effective date of the permit and lasting through the expiration date, the permittee is authorized to discharge from Outfall TX1 (functionally identical to Outfall 001). The discharge consists of biologically treated municipal wastewater. Such discharge shall be limited and monitored by the permittee as specified below.

The permittee is encouraged to perform required biomonitoring or whole effluent testing (WET) activities as early in the reporting period as is practical to ensure sufficient time remains in the reporting period should retests/repeat tests be necessary.

All laboratory analyses for the biomonitoring parameters specified in this permit must be performed by a laboratory certified by DEQ for those parameters.

Acute WET Reporting and Monitoring Requirements (Outfall TX1)

Effluent Characteristic			Reporting/Monitoring Requirements			
Test	Critical Dilution ^a	Parameter	48-hour Min	Testing Frequency ^e	Sample Type	
Routine Testing	<i>Daphnia pulex</i> , 48-hour acute LC ₅₀ static renewal, freshwater	Pass/Fail Survival [TIM3D]	Report	1 per quarter ^d	24-hour composite	
		LC ₅₀ Effluent Conc. [TAM3D]	Report			
		% Mortality at 100% Effluent [TJM3D]	Report			
	<i>Pimephales promelas</i> (Fathead minnow), 48-hour acute LC ₅₀ static renewal, freshwater	100%	Pass/Fail Survival [TIM6C]	Report	1 per quarter ^d	24-hour composite
			LC ₅₀ Effluent Conc. [TAM6C]	Report		
			% Mortality at 100% Effluent [TJM6C]	Report		
Retesting	Retest #1 [22415] ^b		Report	As Required ^e	24-hour composite	
	Retest #2 [22416] ^b		Report			

^a All acute WET testing shall use the dilution series specified in Part II, Section E, Item 1.a of the permit.

^b Applies to either or both test species according to results of test failure triggering monthly retests.

^c Monthly retesting required only if routine test for reporting period (for either species) fails. Fill out ONLY these 2 retest parameters on the retest DMRs, do not change the original results, and enter the correct submission date.

^d Results of retests conducted pursuant to prior test failure shall not be substituted on DMRs in lieu of routine test results. Also see Part II, Section E, Item 2.a of the permit for additional information.

^e Provision for monitoring frequency reduction after the first year is available in Part II, Section E, Item 5 of the permit.

D. pulex WET reporting and monitoring requirements apply beginning the effective date of the permit, and the first reporting period is 1, 2021 to 31, 2021. The first report is due on 15, 2021.

P. promelas (Fathead minnow) WET reporting and monitoring requirements apply beginning the effective date of the permit, and the first reporting period is 1, 2021 to 31, 2021. The first report is due on 15, 2021.

WET testing summary reports: Reports of all WET testing initiated, regardless of whether such tests are carried to completion, shall follow the requirements of Part II, Section E, Item 4 of the permit.

Concurrent testing provision for acute WET testing – Concurrent analyses of ammonia and pH are required for each individual effluent sample collected for acute WET testing or retesting of the Fathead minnow species. Reporting of concurrent testing results shall be in accordance with the following requirements. Results shall also be submitted in or concurrently with each WET test report.

Concurrent Effluent Testing for Acute WET Tests – Reporting Requirements (Outfall TX1)

Effluent Characteristic	Concentration			Monitoring Requirements	
	Daily Min	Monthly Avg	Daily Max	Monitoring Frequency ^a	Sample Type
Ammonia, (NH ₃ -N) (mg/L) ^{b, c} [STORET 00610]	Report	Report	Report	1 per quarter	24-hour composite ^c
pH (standard unit) ^{b, c} [STORET 00400]	Report	N/A	Report	1 per quarter	Measured in each composite effluent sample, including static renewals, just prior to first use ^c

^a See provision for WET testing monitoring frequency reduction after the first year (Part II, Section E, Item 5 of the permit).

^b Two sets of samples for concurrent analyses are required for ammonia and pH. Report only those effluent samples collected for WET testing of the Fathead minnow species.

^c Samples collected for WET testing purposes, including static renewals, shall be of sufficient volume to allow for the required concurrent analyses in addition to the WET testing itself.

Samples sent directly to a WET testing laboratory shall NOT undergo any preservation other than refrigeration to maintain a temperature at or below 6°C but not frozen prior to arrival and processing at the WET testing laboratory. These results should be used in the table above. Samples sent directly to a state certified analytical laboratory must be composite samples that are properly preserved. These results may be included in the results for Outfall 001.

A second concurrent analysis is required for the sample that is sent to the WET testing laboratory and for the table above. Just prior to first use of each composite sample for WET testing purposes, the biomonitoring laboratory shall take an adequately-sized portion of each composite sample, acidify it in accordance with preservation requirements in 40 CFR Part 136, and have it analyzed for ammonia (NH₃-N) at a state certified laboratory.

The pH measurement required for the above table must be taken just prior to the acidification step. These pH and ammonia readings should NOT be included in the results for Outfall 001.

Concurrent ammonia analyses must be performed on composite samples that are properly preserved and delivered directly to a State certified analytical laboratory. These results shall be included in the results for Outfall 001.

Sampling location – Samples taken in compliance with the monitoring requirements specified above for Outfall TX1 shall be taken at the following location: at the same location as for Outfall 001.

2. Chronic WET Test (Outfall TX1)

During the period beginning the effective date of the permit and lasting through the expiration date, the permittee is authorized to discharge from Outfall TX1 (functionally identical to Outfall 001). Such discharges shall be limited and monitored by the permittee as specified below.

The permittee is encouraged to perform required biomonitoring or whole effluent toxicity (WET) testing activities as early in the reporting period as is practical to ensure sufficient time remains in the reporting period should retests/repeat tests be necessary.

All laboratory analyses for the biomonitoring parameters specified in this permit must be performed by a laboratory certified by DEQ for those parameters.

Chronic WET Test Reporting and Monitoring Requirements (Outfall TX1)

Effluent Characteristic			Reporting/Monitoring Requirements ^a			
Test	Critical Dilution ^d	Parameter	7-day Min	Testing Frequency ^f	Sample Type	
Routine Testing	<i>Ceriodaphnia dubia</i> , 7-day chronic NOEC static renewal, freshwater	Pass/Fail Survival [TLP3B]	Report	1 per quarter ^e	24-hour composite	
		NOEC _L Survival [TOP3B]	Report			
		% Mortality at Critical Dilution [TJP3B]	Report			
		Pass/Fail Reproduction [TGP3B]	Report			
		NOEC _S Reproduction [TPP3B]	Report			
		% Coeff of Variation [TQP3B]	Report			
	<i>Pimephales promelas</i> (Fathead minnow), 7-day chronic NOEC static renewal, freshwater	15%	Pass/Fail Survival [TLP6C]	Report	1 per quarter ^e	24-hour composite
			NOEC _L Survival [TOP6C]	Report		
			% Mortality at Critical Dilution [TJP6C]	Report		
			Pass/Fail Growth [TGP6C]	Report		
			NOEC _S Growth [TPP6C]	Report		
			% Coeff of Variation [TQP6C]	Report		
Retesting	Retest #1 [22415] ^b		Report	As required ^c	24-hour composite	
	Retest #2 [22416] ^b		Report			

- ^a See Part II, Section F, chronic WET testing of the permit, for additional monitoring and reporting conditions.
- ^b Applies to either or both test species according to results of test failure triggering monthly retests.
- ^c Monthly retesting required only if routine test for reporting period (for either species) fails. Fill out ONLY these two retest parameters on the retest DMRs, do not change the original results, and put the correct submission date in the lower right hand corner of the DMR.
- ^d All chronic WET testing shall use the dilution series specified in Part II, Section F, Item 1 of the permit.
- ^e Results of retests conducted pursuant to prior test failure shall not be submitted on DMRs in lieu of routine test results (see Part II, Section F, Item 2.a of the permit).
- ^f See provision for monitoring frequency reduction after the first year (Part II, Section F, Item 5 of the permit).

C. dubia WET reporting and monitoring requirements apply beginning 1, 2021, and the first reporting period is 1, 2021 to 29, 2021.

P. promelas (Fathead minnow) WET reporting and monitoring requirements apply beginning 1, 2021, and the first reporting period is 1, 2021 to 29, 2021.

WET testing summary reports: Reports of all WET testing initiated, regardless of whether such tests are carried to completion, shall follow the requirements of Part II, Section F, Item 4 of the permit.

Concurrent testing provision for chronic WET testing – Concurrent analyses of ammonia and pH are required for each individual effluent sample collected for chronic WET testing or retesting of the Fathead minnow species. Reporting of concurrent testing results shall be in accordance with the following requirements. Results shall also be submitted in or concurrently with each WET test report.

Concurrent Effluent Testing for Chronic WET Tests Reporting Requirements (Outfall TX1)

Effluent Characteristic	Concentration			Monitoring Requirements	
	Daily Min	Monthly Avg	Daily Max	Monitoring Frequency ^a	Sample Type
Ammonia, (NH ₃ -N) (mg/l) ^{b,c} [STORET 00610]	Report	Report	Report	1 per quarter	24-hour composite ^c
pH (standard unit) ^{b,c} [STORET 00400]	Report	N/A	Report	1 per quarter	Measured in each composite effluent sample, including static renewals, just prior to first use ^c

^a See provision for WET testing monitoring frequency reduction after the first year (see Part II, Section F, Item 5 of the permit).

^b Report only those effluent samples collected for WET testing of the Fathead minnow species.

^c Samples collected for WET testing purposes, including static renewals, shall be of sufficient volume to allow for the required concurrent analyses in addition to the WET testing itself.

Two sets of samples for **concurrent analyses** are required for ammonia and pH:

Samples sent directly to a WET testing laboratory shall NOT undergo any preservation other than refrigeration to maintain a temperature at or below 6° C but not frozen prior to arrival and processing at the WET testing laboratory. These results may be used in the table above.

A second concurrent analysis is required for the sample that is sent to the WET testing laboratory and for the table above. Just prior to the first use of each composite sample for WET testing purposes, the biomonitoring laboratory shall take an adequately-sized portion of each composite sample, acidify it in accordance with preservation requirements in 40 CFR Part 136, and have it analyzed for ammonia (NH₃-N) at a State certified analytical laboratory.

The pH measurement required for the above table must be taken just prior to the acidification step. These pH and ammonia readings should NOT be included in the results for Outfall 001.

Samples sent directly to a State certified analytical laboratory must be composite samples that are properly preserved. These results may be included in the results for Outfall 001.

Sampling location – Samples taken in compliance with the monitoring requirements specified above for Outfall TX1 shall be taken at the following location: at the same location as for Outfall 001.

C. Background Monitoring (Monitoring Point 999)

From the beginning of the fourth year of the permit, the permittee shall monitor and report background levels of the following pollutant(s) in the Washita River as follows:

Background Monitoring Requirements
(concentration in µg/L, unless otherwise specified)

Pollutant	Concentration	Monitoring Requirements	
		Frequency ^a	Type Sample
Mercury, total	Report	1 per month	Grab

^a A minimum of 10 valid samples shall be collected. The facility shall continue monitoring until 10 samples have been collected.

Background monitoring samples must be taken from within the channel of Washita River at a location immediately upstream from, but not affected by the discharge from Outfall 001. Sample results shall be reported monthly on eDMR.

D. Compliance Schedule

Not applicable.

E. Sanitary Sewer Overflows

Any bypass in the collection system [sanitary sewer overflow (SSO)] shall be reported in accordance with Part III.B.6 of the Permit.

F. Reporting of Monitoring Results

Monitoring results shall be reported in accordance with the provisions of Part III.B.5 of the permit. Monitoring results obtained during the previous month shall be summarized and electronically reported on an electronic Discharge Monitoring Report (eDMR) form due to the Wastewater Compliance Tracking Section, Water Quality Division, DEQ no later than the 15th day of the month following the completed monthly test. If no discharge occurs during the reporting period, an eDMR form stating "No Discharge" shall be electronically submitted according to the above schedule. Instructions on how to register as a Preparer or Signatory for eDMR, as well as how to prepare and submit eDMR, can be found on DEQ's website at <https://www.deq.ok.gov/water-quality-division/electronic-reporting/>. Assistance is also available by contacting DEQ at (405) 702-8100 or email deqreporting@deq.ok.gov.

The first report is due on the 15th of MONTH, 2020.

G. Reclaimed Water Limitations and Monitoring Requirements (Permit to Supply Reclaimed Water No. RW20-013 and Reclaimed water User Number: RWID20-004)

Beginning the effective date and lasting through the expiration date of the permit, Chickasha Municipal Authority/the permittee - "the supplier" - is authorized to supply treated wastewater from its wastewater treatment facility as Category 3 reclaimed water (RW) for the irrigation of 2 sites of OSU – South Central Research Station listed below, in accordance with OAC 252:627 and OAC 252:656 and the following limitations. This permit replaces and supersedes land application operational Permit No. LAR000026150194 that was issued on September 22, 2015.

1. Authorized Irrigation Sites for Category 3 Reclaimed Water

The location and other related information on 2 irrigation sites owned and operated by OSU, "the user" of the RW are listed in the following table:

Authorized Irrigation Sites for Category 3 RW

Irrigation Site		Total Area (Acres) ^a	Irrigated Area (Acres) ^a	Location of Irrigation Pivot or Point of Entry to the Site	
Site ^b	Legal Description			Latitude	Longitude
R01 (Little Pivot)	N½, NE¼, SW¼ and S½, SE¼, NW¼ Section 35, Township 7North, Range 17 West, IM, Grady County	26	13	35° 02' 13.30" N (GPS: NAD83)	97° 54' 38.70" W (GPS: NAD83)
R02 (Linear)	E½, NE¼, NW¼ and W½, NW¼, NE¼ Section 35, Township 7North, Range 17 West, IM, Grady County	40	40	35° 02' 30.20" N (GPS: NAD83)	97° 54' 34.70" W (GPS: NAD83)

^{a.} Information on total acreage and irrigated area were provided by the City of Chickasha.

^{b.} Sites belong to the "user," South Central Research Station of Oklahoma State University (OSU), User ID No. RWID20-004.

2. Limitations and Monitoring Requirements for Category 3 Reclaimed Water

In accordance with Appendix A of OAC 252:627, the following limitations and monitoring requirements are established for each irrigation site in the draft permit to supply Category 3 reclaimed water by the permittee to the irrigation sites of OSU – South Central Research Station listed above.

Limitations and Monitoring Requirements for Category 3 RW(Applicable to site R01 and R03) ^a

Parameter		Limits	Frequency	Sample Type	Monitoring Location
Flow, in mgd	Year round	N/A	Daily	Totalized	Flow meters at irrigation site ^{b, c, d}
Free Available Chlorine Residual	Year round	≥ 0.2 mg/L	Every 12 hours ^e	Grab	Intake of turbine pumps at the end of the chlorine contact basin at WWTF
<i>E. coli</i> ^f	May – Sep	Monthly Geo. Mean: < 126 Daily Max: < 406	3 per week ^g	Grab	Parshall flume at WWTF
	Oct – Apr	Monthly Geo. Mean: < 126 Daily Max: < 406	3 per week ^h		
Nitrogen	Year round	\leq most stringent agronomic rate, in mg/L	1 per month	Grab	Auto sampler at WWTF
Phosphorous	Year round	\leq most stringent agronomic rate, in mg/L	1 per month	Grab	
CBOD ₅	Jun – Oct	< 20 mg/L	1 per week ^g	24-hour composite	
BOD ₅	Nov – May	< 20 mg/L	1 per week ^g		

^a Separate Monthly Operating Reports (MORs) shall be maintained for each site.

^b The readings of flow meters at 2 irrigation sites communicated by the user will be compared with the flow meter at the wastewater treatment facility (WWTF). Significant differences may indicate leakage in the reclaimed water distribution system.

^c In accordance with OAC 252:656-25-2(h), flow measurement for each land application site shall be accomplished by flow meters, or the calibration of pumps and installation of run-time meters. Flow may also be determined from the hydraulic loading limit calculated in accordance with Appendix D of OAC 252:656, and the irrigated area stated in Part I, Section G, Item 1 of the permit.

^d When there is no supply of reclaimed water for the entire day, report “0” for the flow in the MOR and write “No Supply” in the comments column.

^e The supplier shall take the first sample of the day for FAC residual before starting the turbine pumps and if the duration of the supply is less than 12 hours, the second sample will be taken prior to turning off the turbine pumps.

^f *E. coli* shall be reported in most-probable number (MPN)/100 mL of reclaimed water.

^g Results of samples taken from the effluent discharge monitoring may be used to comply with the water reuse requirement.

^h Due to intermittent nature of irrigation during the months of October through April, the supplier shall take samples of reclaimed water for *E. coli* on the day reclaimed water is pumped to the user. The daily sampling for *E. coli* may be discontinued after 3 daily samples of reclaimed water have been taken in each week during the months of October through April. If no RW is supplied for the entire week, sampling for *E. coli* is not necessary.

3. Record Keeping of Monitoring Results

In accordance with OAC 252:627-5-1(b), (d), and (e), the supplier shall complete DEQ Form 627-001 - Water Reuse Monthly Operating Report (MOR) for **each site** and maintain the MORs by the supplier at the Chickasha WWTP on-site for at least 3 years and make them available for review by DEQ upon request.

4. Record Keeping Requirements for Commercial Fertilizer

In compliance with OAC 252:627-3-4(b)(7), the permittee is required to keep record of the commercial fertilizer applied at each site for the life of the permit in the following format. These records shall be made available to the DEQ on request.

Site Name: _____

Date	Acreage Fertilized	Composition of Fertilizer (Nitrogen, Phosphorous, Potassium)	Quantity of Fertilizer Applied

5. Restrictions for Category 3 Reclaimed Water

- a. In accordance with OAC 252:627-3-3(b), irrigation with Category 3 reclaimed water is prohibited:
 - (1) from a lagoon cell that receives raw sewage;
 - (2) on public use areas that have a high potential for skin to ground contact (e.g., football fields, sports complexes, and playgrounds);
 - (3) on golf courses unless irrigation takes place when the public is not allowed to access the sites;
 - (4) on any food crop that may be consumed raw;
 - (5) for spray irrigation on orchards or vineyards;
 - (6) at rates that allow a discharge from the permitted irrigation site;
 - (7) within 100 feet of the permitted boundary site;
 - (8) at a rate that exceeds the nitrogen and phosphorus rates for the crop at the site;
 - (9) at a rate that results in phytotoxicity;
 - (10) when the dissolved oxygen concentration for Category 4 reclaimed water is less than 2.0 mg/L; [not applicable to Category 3]
 - (11) during periods of precipitation or while the soil is saturated or frozen;
 - (12) on land having a slope greater than 5 percent;
 - (13) where there are berms or other barriers that would cause the pooling or ponding of reclaimed water at the site, nor shall any berms or barriers impede the natural flow of stormwater from the site;
 - (14) on public use areas during times of use; and
 - (15) on sod farms unless a period of 30 days has elapsed between the last application of Category 3 reclaimed water and harvesting of sod.

- b. In accordance with OAC 252:656-27-2(b), systems shall be designed to ensure that direct and wind-blown spray from irrigation systems and other sources are confined to the designated irrigation areas. Category 3 RW systems shall also be designed to comply with the following

minimum buffer zones and setback distances, with all distances being measured from the edge of the wetted perimeter of the irrigation area to the edge of the following features:

- (1) 300 feet from public wells;
- (2) 50 feet from private water wells;
- (3) 50 feet from creeks, lakes, ponds, and other water of the state;
- (4) 100 feet from adjacent property lines.

6. Prevention of Unauthorized Access to Irrigation Sites

OAC 252:627-3-4(a) for operation and maintenance of reclaimed water requires prevention of unauthorized access to the sites. Sites are enclosed by fences and with sign stating the use of reclaimed water at the irrigation sites.

7. Signage Requirements

- a. In accordance with OAC 252:656-27-4(a), all valves, outlets and appurtenances in the distribution system of RW shall have a sign "CAUTION: CATEGORY 3 RECLAIMED WATER – DO NOT DRINK."
- b. In accordance with OAC 252:627-3-4(a)(2), signs which describe the nature of the facility and advise against trespassing are required to be posted on or near the fence on each side of the water reuse sites.

8. Operation and Maintenance of the Distribution Systems

- a. The permittee/supplier shall maintain the structural integrity of all parts of the treated wastewater (reclaimed water) distribution and irrigation system and maintain it in good working condition.
- b. The permittee/supplier shall ensure that pump stations are properly maintained and operated by doing the followings:
 - (1) Securing pump station(s) to prevent unauthorized access.
 - (2) Maintaining pump(s) in working condition.
 - (3) Keeping screen(s) free of debris to prevent clogging.
 - (4) Maintaining the required alarms in working order.
 - (5) Maintaining the required back-up generators and/or portable engine driven pumps in working order.
 - (6) Maintaining a complete set of operational instructions, emergency procedures and maintenance schedules.
- c. The permittee/supplier shall provide flow measuring devices to measure the amount of treated wastewater being distributed to each user. Flow measurement devices shall have recording, totalizing and instantaneous indicating capabilities.

- d. Cross connections between treated wastewater/RW distribution lines and the public water supply lines are prohibited.

PART II. OTHER PERMIT REQUIREMENTS

A. CONTRIBUTING INDUSTRIES AND PRETREATMENT REQUIREMENTS

1. The permittee shall operate an industrial pretreatment program in accordance with Section 402(b)(8) of the CWA, the General Pretreatment Regulations (40 CFR Part 403) and the provisions of the subsequently approved industrial pretreatment program submitted by the permittee. A Publicly Owned Treatment Works (POTW) facility is defined in 40 CFR § 403.3(q) as any devices and systems used in storage, treatment, recycling and reclamation of municipal sewage and industrial wastes of a liquid nature. It includes sewers, pipes and other conveyances if they convey wastewater to a POTW. The term also means a municipality as defined in the Act, which has jurisdiction over the Indirect Discharges to and from such treatment works. The POTW pretreatment program was approved on December 24, 1983 and modified on November 9, 1984; September 24, 1993 and July 10, 2008 to incorporate program revisions; **the current POTW pretreatment program is being modified to incorporate the latest 40 CFR Part 403 regulations adopted by DEQ effective June 15, 2007.** Any non-substantial modifications [as defined under 40 CFR § 403.18(b)] to the POTW pretreatment program received and implemented in accordance with 40 CFR § 403.18(d) shall be considered incorporated as of the date of approval by DEQ. The current POTW pretreatment program is hereby incorporated by reference and shall be implemented in a manner consistent with the following requirements:
 - a. Industrial user information shall be updated at a frequency adequate to ensure that all industrial users (IU) are properly characterized at all times;
 - b. The frequency and nature of industrial user compliance monitoring activities by the permittee shall be commensurate with the character, consistency and volume of waste. The permittee must inspect and sample the effluent from each Significant Industrial User in accordance with 40 CFR § 403.8(f)(2)(v). This is in addition to any industrial self-monitoring activities;
 - c. The permittee shall enforce and obtain remedies for noncompliance by any industrial users with applicable pretreatment standards and requirements;
 - d. The permittee shall control through permit, order, or similar means, the contribution to the POTW by each IU to ensure compliance with applicable pretreatment standards and requirements. In the case of IU identified as significant under 40 CFR § 403.3(v), this control shall be achieved through individual or general control mechanisms in accordance with 40 CFR § 403.8(f)(1)(iii). Both individual and general control mechanisms must be enforceable and contain, at a minimum, the following conditions:
 - (1) Statement of duration (in no case more than 5 years);
 - (2) Statement of non-transferability without, at a minimum, prior notification to the POTW and provision of a copy of the existing control mechanism to the new owner or operator;
 - (3) Effluent limits and/or Best Management Practices based on applicable general and categorical Pretreatment Standards, local limits, and State and local laws;
 - (4) Self-monitoring, sampling, reporting, notification and record keeping requirements, including an identification of the pollutants to be monitored (including the process for seeking pollutant waivers in accordance with 40 CFR § 403.12(e)(2)), sampling location, sampling frequency, and sample type, based on the applicable general and categorical Pretreatment Standards, local limits, and State and local laws; and

- (5) Statement of applicable civil and criminal penalties for violation of Pretreatment Standards and requirements and any applicable compliance schedule. Such schedules may not extend the compliance date beyond federal deadlines; and
 - (6) Requirements to control slug discharges, if determined by the POTW to be necessary.
- e. The permittee shall evaluate whether each Significant Industrial User needs a plan or other action to control slug discharges in accordance with 40 CFR § 403.8(f)(2)(vi);
 - f. The permittee shall provide adequate staff, equipment, and support capabilities to carry out all elements of the pretreatment program; and
 - g. The approved program shall not be modified by the permittee without the prior approval of DEQ.
2. The permittee shall establish and continue to develop and enforce technically based local limits (TBLL) to implement the provisions of 40 CFR § 403.5. POTWs may develop Best Management Practices (BMPs) to implement paragraphs 40 CFR § 403.5 (c)(1) and (c)(2). Such BMPs shall be considered local limits and Pretreatment Standards. All specific prohibitions or limits developed under this requirement are deemed to be conditions of this permit. The general and specific prohibitions set out in 40 CFR § 403.5(a)(1) and (b) shall also be enforced by the permittee unless modified under this provision.

The permittee shall, within 60 days of the effective date of this permit, (1) submit a WRITTEN CERTIFICATION that a technical evaluation has been performed demonstrating that the existing TBLL are based on the current state water quality standards and are adequate to prevent pass through of pollutants, inhibition of or interference with the treatment facility, worker health and safety problems, and sludge contamination, **or** (2) submit a WRITTEN NOTIFICATION that a technical evaluation revising the current TBLL and a draft sewer use ordinance which incorporates such revisions will be submitted within 12 months of the effective date of this permit.

3. The permittee shall analyze, at a minimum the treatment facility influent and effluent for the presence of the toxic pollutants listed in 40 CFR Part 122, Appendix D (NPDES Application Testing Requirements) Table II at least annually (once per year) and the toxic pollutants in Table III plus molybdenum at least semi-annually (once per six months). If, based upon information available to the permittee there is reason to suspect the presence of any toxic or hazardous pollutant listed in Table V, or any other pollutant, known or suspected to adversely affect treatment plant operation, receiving water quality, or solids disposal procedures, analysis for those pollutants shall be performed at least semi-annually (once per six months) on both the influent and the effluent.

The influent and effluent samples collected shall be flow-composite samples consisting of at least 12 aliquots collected at approximately equal intervals over a representative 24-hour period. Sampling and analytical procedures shall be in accordance with guidelines established in 40 CFR Part 136. The effluent samples shall be analyzed to a level as required in item 6 below. Where composite samples are inappropriate, due to sampling, holding time, or analytical constraints, grab samples shall be taken.

4. The permittee shall prepare annually a list of IUs which during the preceding pretreatment year were significantly noncompliant with applicable pretreatment requirements. For the purposes of this Part, significant noncompliance shall be determined based upon the more stringent of either criterion established at 40 CFR Part § 403.8(f)(2)(viii) or criteria established in the approved POTW pretreatment program. This list is to be published annually in a newspaper of general circulation that provides meaningful public notice within the jurisdiction(s) served by the POTW during the month of **December**.

In addition, during the month of **December** the permittee shall submit an updated status report to DEQ containing the following information:

- a. An updated list of all Non-significant Categorical Industrial Users defined under 40 CFR § 403.3(v)(2) if applicable, Categorical Industrial Users subject to reduced reporting under 40 CFR § 403.12(e)(3) if applicable and Significant Industrial Users. For each industrial user listed the following information shall be included:
 - (1) Standard Industrial Classification (SIC) or North American Industry Classification System (NAICS) code and categorical determination;
 - (2) Control document status. Whether the user has an effective control document, and the date such document was last issued, reissued, or modified, (indicate which industrial users were added to the system (or newly identified) within the previous year);
 - (3) A summary of all monitoring activities performed within the previous year. The following information shall be reported:
 - total number of inspections performed;
 - total number of sampling visits made;
 - (4) Status of compliance with both effluent limitations and reporting requirements. Compliance status shall be defined as follows:
 - Compliant (C) - no violations during the previous pretreatment year;
 - Non-compliant (NC) - one or more violations during the previous pretreatment year but does not meet the criteria for significant non-compliance;
 - Significantly Noncompliant (SNC) - in accordance with requirements described above;and
 - (5) For significantly noncompliant IUs, indicate the nature of the violations, the type and number of actions taken (notice of violation, administrative order, criminal or civil suit, fines or penalties collected, etc.) and current compliance status. If ANY industrial user was on a schedule to attain compliance with effluent limits, indicate the date the schedule was issued and the date compliance is to be attained.
- b. A list of all significant industrial users (SIU) whose authorization to discharge was terminated or revoked during the preceding pretreatment year and the reason for termination;
- c. A report on any interference, pass through, upset or POTW permit violations known or suspected to be caused by industrial contributors and actions taken by the permittee in response;
- d. A copy of the newspaper publication of the significantly non-compliant industrial users giving the name of the newspaper and the date published;
- e. The results of all influent and effluent analyses performed pursuant to above requirements;
- f. A comparison of the influent and effluent analyses performed pursuant to above with maximum allowable headwork loadings developed in the approved technically based local limits and water quality-based effluent concentrations necessary to meet state water quality standards.

5. The permittee shall provide adequate notice of the following:
 - a. Any new introduction of pollutants into the treatment works from an indirect discharger which would be subject to Sections 301 and 306 of the CWA and/or 40 CFR Parts 405-499 if it were directly discharging those pollutants; and
 - b. Any substantial change in-the volume or character of pollutants being introduced into the treatment works by a source introducing pollutants into the treatment works at the time of issuance of the permit.

Adequate notice shall include information on (i) the quality and quantity of effluent to be introduced into the treatment works, and (ii) any anticipated impact of the change on the quality or quantity of effluent to be discharged from the POTW.

6. All effluent monitoring conducted pursuant to above requirements shall meet the Minimum Quantification Levels (MQLs) shown in the tables at the end of Part II of the permit.

B. REOPENER CLAUSE

This permit may be reopened for modification or revocation and reissuance to require additional monitoring and/or effluent limitations where actual or potential exceedances of State water quality criteria are determined to be the result of the permittee's discharge to the receiving water(s), or a revised Total Maximum Daily Load is established for the receiving water(s), or when required as technology advances. Modification or revocation and reissuance of the permit shall follow regulations listed at 40 CFR § 124.5

C. BIOSOLIDS/SEWAGE SLUDGE REQUIREMENTS

1. The sewage sludge disposal practices shall comply with the federal regulations for landfills, sludge, and solid waste disposal established at 40 CFR Parts 257, 503, and the DEQ rules governing Sludge Management (OAC 252:515 and OAC 252:606) as applicable.
2. The sludge disposal shall also comply with the requirements of the Sludge Disposition Plan for the Chickasha Municipal Authority, approved by DEQ on April 22, 2010, that allows the permittee to landfill sewage sludge at the Southern Plains Landfill, located in Section 3, Township 5 North, Range 6 West, IM, Grady County, Oklahoma (Landfill Permit No. 3526013), approved by DEQ.
3. The permittee is required to maintain all records relevant to sewage sludge disposal for the life of the permit. These records shall be made available to DEQ upon request.
4. The permittee shall give 120 days prior notice to DEQ of any change planned in the sewage sludge disposal practice.
5. The permittee shall also comply with all applicable biosolids/sewage sludge requirements in Part IV of this permit.

D. POLLUTION PREVENTION REQUIREMENTS

1. The permittee shall institute a program within 12 months of the effective date of the permit (or continue an existing program) directed towards optimizing the efficiency and extending the useful life of the facility. The permittee shall consider the following items in the program:
 - a. The influent loadings, flow and design capacity;

- b. The effluent quality and plant performance;
 - c. The age and expected life of the wastewater treatment facility's equipment;
 - d. Bypasses and overflows of the tributary sewerage system and treatment works;
 - e. New developments at the facility;
 - f. Operator certification and training plans and status;
 - g. The financial status of the facility;
 - h. Preventative maintenance programs and equipment conditions; and
 - i. An overall evaluation of conditions at the facility.
2. The permittee shall prepare the following information on the biosolids/sewage sludge generated by the facility:
- a. An annual quantitative tabulation of the ultimate disposition of all biosolids/sewage sludge (including, but not limited to, the amount beneficially reused, landfilled, and incinerated).
 - b. An assessment of technological processes and an economic analysis evaluating the potential for beneficial reuse of all biosolids/sewage sludge not currently beneficially reused including a listing of any steps which would be required to achieve the biosolids/sewage sludge quality necessary to beneficially reuse the biosolids/sewage sludge.
 - c. A description of, including the expected results and the anticipated timing for, all projects in process, in planning and/or being considered which are directed towards additional beneficial reuse of biosolids/sewage sludge.
 - d. An analysis of one composite sample of the biosolids/sewage sludge collected prior to ultimate re-use or disposal shall be performed for the pollutants listed in Part IV, Element 1, Section III, Table 3.
 - e. A listing of the specific steps (controls/changes) which would be necessary to achieve and sustain the quality of the biosolids/sewage sludge so that the pollutant concentrations in the biosolids/sewage sludge fall below the pollutant concentration criteria listed in Part IV, Element 1, Section III, Table 3.
 - f. A listing of, and the anticipated timing for, all projects in process, in planning, and/or being considered which are directed towards meeting the biosolids/sewage sludge quality referenced in (e) above.

The permittee shall certify in writing, within three years of the effective date of the permit, that all pertinent information is available. This certification shall be submitted to:

Oklahoma Department of Environmental Quality
Water Quality Division
Municipal Discharge and Stormwater Permit Section
P. O. Box 1677
707 North Robinson Ave
Oklahoma City, Oklahoma 73101-1677

E. ACUTE WET TESTING REQUIREMENTS

1. Scope and Methodology

- a. The permittee shall test the effluent for toxicity in accordance with the provisions in this section, which apply individually and separately to the outfalls listed below. No samples or portions of samples from one outfall may be composited with samples or portions of samples from another outfall. The permittee shall bio-monitor for *Daphnia pulex* and *Pimephales promelas* (Fathead minnows) in accordance with the WET testing frequencies prescribed in Part I of the permit.

The permittee is encouraged to perform required biomonitoring activities as early in the reporting period as is practical to ensure sufficient time remains in the reporting period should retests/repeat tests be necessary.

All laboratory analyses for the biomonitoring parameters specified in this permit must be performed by a laboratory certified by DEQ for those parameters.

Provisions for performance-based monitoring frequency reductions are contained in Item 5 of this section.

Intervals between test initiation dates shall be a function of the required testing frequency, as follows:

- Monthly: No less than 20 days and no more than 40 days.
- Quarterly: No less than 2 months and no more than 4 months.
- Semi-annually: No less than 4 months and no more than 8 months.

APPLICABLE TO OUTFALL(S):	001
REPORTED ON DMR AS OUTFALL(S):	TX1
CRITICAL DILUTION:	100%
EFFLUENT DILUTION SERIES (ALL TESTS):	32%, 42%, 56%, 75%, 100%
SAMPLE TYPE:	Defined at Part I
TEST SPECIES/METHODS:	40 CFR Part 136, except for changes required by EPA, Region 6.

Daphnia pulex acute static renewal 48-hour definitive toxicity test, Method 2021.0, EPA-821-R-02-012 (October 2002), or latest update thereof. A minimum of 5 replicates with 8 organisms per replicate must be used in the control and in each effluent dilution of this test.

Pimephales promelas (Fathead minnow) acute static renewal 48-hour definitive toxicity test, Method 2000.0, EPA-821-R-02-012 (October 2002), or latest update thereof. A minimum of 5 replicates with 8 organisms per replicate must be used in the control and in each effluent dilution of this test.

- b. Acute test failure –Acute test failure (LC₅₀ test) is defined as 50 percent or more lethality (toxicity) at 48 hours to test organisms at any effluent concentration. The 48-hour LC₅₀ effluent value must be greater than 100 percent to indicate a passing test. Any 48-hour LC₅₀ effluent

value of 100 percent or less (or equivalently, a survival value of less than 50.1 percent in any test dilution) will constitute a test failure.

- c. Reopener clause – This permit may be reopened to require whole effluent toxicity limits, chemical specific effluent limits, additional testing, and/or other appropriate actions to address toxicity.

2. Testing Requirements due to Test Failure

Upon becoming aware of the failure of any test, the permittee shall immediately notify the DEQ Water Quality Division biomonitoring coordinator, and shall provide written notification within 5 working days, of the test failure with a summary of the results of, and any other pertinent circumstances associated with, the failed test.

- a. Whenever there is a test failure for *Daphnia pulex* and/or Fathead minnows during routine testing, the frequency of testing for *Daphnia pulex* and/or Fathead minnows shall automatically increase to, or continue at, as appropriate, the WET testing frequency prescribed in Part I for the remaining life of the permit. In addition, 2 additional monthly tests (retests) of *Daphnia pulex* and/or Fathead minnows are required. The 2 additional tests shall be conducted monthly during the next 2 consecutive months. The permittee shall not substitute either of the 2 additional tests for routine toxicity testing. A full laboratory report for the failed routine test and both additional tests, if required, shall be prepared and submitted to DEQ in accordance with procedures outlined in Item 4 of this section.
- b. Persistent toxicity – If either of the 2 additional tests results in an LC₅₀ value less than or equal to 100 percent, persistent toxicity is exhibited. Then the permittee shall initiate a Toxicity Reduction Evaluation (TRE) as specified in Item 6 of this section. The TRE initiation date will be the test completion date of the first failed retest. The permittee may request a temporary exemption to this TRE-triggering criterion only if the permittee is under a compliance schedule defined in an OPDES permit or an enforcement order to effect aquatic toxicity reduction measures.
- c. Intermittent toxicity – If both additional tests result in an LC₅₀ value of greater than 100 percent persistent toxicity is not exhibited. However, if any routine test failure occurs within 18 months of a prior test failure, intermittent toxicity is exhibited, and the permittee may be required by DEQ to initiate a TRE, as described in Item 6 of this section, based on the severity and pattern of such toxic effect over time.
- d. Suspension of Retesting Requirement during TRE - Retesting requirements in Item 2.a are temporarily suspended upon submittal of a TRE Action Plan. Such suspension of retesting requirements applies only to the species under evaluation by a TRE and only to the period during which a TRE is being performed.

3. Required Toxicity Testing Conditions

- a. Test acceptance – The permittee shall repeat a test, including the control and all effluent dilutions, if the procedures and quality assurance requirements defined in the test methods or in this permit are not satisfied, including the following additional criteria:
 - (1) The toxicity test control (0% effluent) must have survival equal to or greater than 90 percent.
 - (2) The percent coefficient of variation between replicates shall be 40 percent or less in the control (0% effluent) for the *Daphnia pulex* and Fathead minnow survival tests.

- (3) The percent coefficient of variation between replicates shall be 40 percent or less in the critical dilution, unless significant toxicity is exhibited in the *Daphnia pulex* and Fathead minnow survival tests.
- (4) As documented at test termination, no more than 40 percent of the daphnid test organisms in any replicate of any effluent dilution or in any replicate of the control (0% effluent) shall be male.

If the above criteria or criteria listed in Item 1.a are not met the test will be considered invalid. Test failure may not be construed or reported as invalid due to a coefficient of variation value for toxicity of greater than 40 percent for replicates tested at the critical dilution. A repeat test shall be conducted and the biomonitoring enforcement coordinator notified, within the reporting period of any test determined to be invalid.

- b. The permittee shall follow the requirements listed below in determining success or failure of a WET test:

The statistical analyses in the *Daphnia pulex* and the Fathead minnow survival tests, used to determine the LC₅₀ shall be in accordance with the methods described in EPA-821-R-02-012, or the most recent update thereof.

- c. The permittee shall use dilution water that meets the following standards:

- (1) Dilution water used in the toxicity tests will be receiving water collected as close to the point of discharge as possible but unaffected by the discharge. In OAC 252:690-3-36, for discharges to a receiving stream classified as intermittent or to a receiving stream with no flow due to zero flow, the permittee shall substitute synthetic dilution water of similar pH, hardness and alkalinity to the closest downstream perennial water where the toxicity test is conducted. In the event that the receiving stream has sufficient flow for a sample to be collected, the facility will return to receiving stream water instead of synthetic.
- (2) If the receiving water is unsatisfactory as a result of instream toxicity (fails to meet the test acceptance criteria in Item 3.a), the permittee must submit the test results exhibiting receiving water toxicity with the full test report required in Item 4 below and may thereafter substitute synthetic dilution water for the receiving water in all subsequent tests, provided the unacceptable receiving water test met the following stipulations:
 - (a) a synthetic dilution water control which fulfills the test acceptance requirements of Item 3.a was run concurrently with the receiving water control;
 - (b) the test indicating receiving water toxicity was carried out to completion (i.e., 48 hours);
 - (c) the synthetic dilution water had a pH, hardness and alkalinity similar to that of the receiving water or closest downstream perennial water not adversely affected by the discharge, provided the magnitude of these parameters will not cause toxicity in the synthetic dilution water; and
 - (d) the receiving water test must be conducted at the start of each permitting cycle.

- d. The permittee shall collect samples that are representative of their effluent by following the criteria listed below:

- (1) Unless grab sampling is specifically authorized in Part I of the permit, the permittee shall collect 2 flow-weighted 24-hour composite samples representative of the flows during normal operation from the outfall(s) listed at Item 1.a above. If grab sampling is authorized, all the requirements listed below for composite sampling also pertain to grab sampling. In such cases, collection of the grab sample is considered equivalent to collection of the last portion of a composite sample. Unless otherwise specified in Part I of the permit, a 24-hour composite sample consists of a minimum of 12 effluent portions collected at equal time intervals representative of a 24-hour operating day and combined proportional to flow, or a sample continuously collected proportional to flow over a 24-hour operating day.
- (2) The permittee must collect the composite samples so that the maximum holding time for any effluent sample shall not exceed 36 hours. The permittee must initiate the toxicity test within 36 hours after the collection of the last portion of the first composite sample. The first composite sample shall be used to initiate each test. The second composite sample shall be used for 24-hour static renewal of each dilution concentration for each test. Samples shall be chilled to maintain a temperature at or below 6° C but not frozen during collection, shipping, and/or storage.
- (3) The permittee must collect the composite samples such that the effluent samples are representative of any periodic episode of chlorination, biocide usage or other potentially toxic substance discharged on an intermittent basis.
- (4) If it is anticipated that flow from the outfall being tested may cease prior to collection of the 2nd composite sample, the permittee must ensure that the 1st composite sample is of sufficient volume to complete the required testing with daily renewal of effluent. The abbreviated composite sample collection duration, the static renewal protocol associated with an abbreviated sample collection, and a summary of the circumstances justifying collection of an abbreviated sample must be adequately documented in the full test report required in Item 4 below. DEQ reserves the right to require a retest and/or consider the permittee in violation of this permit if the basis offered for justification of an abbreviated sample is insufficient, flawed, or in any way reflects an effort on the part of the permittee to avoid test failure by use of an abbreviated sample.

4. Reporting

- a. The permittee shall retain each full report pursuant to the records retention provisions of Part III of this permit. The permittee shall also submit to the DEQ biomonitoring enforcement coordinator a copy of the full laboratory test reports at TX1 in accordance with the Report Preparation Section of EPA-821-R-02-012 for every valid or invalid toxicity test initiated, whether carried to completion or not, including any test which is considered invalid, is terminated early for any reason, or which indicates receiving water toxicity. The reports shall be received no later than the 15th day of the month following the end of the testing period.

As of October 22, 2015, the EPA published the “NPDES Electronic Reporting” final rule, with an effective date of December 21, 2015, which requires the electronic reporting and sharing of NPDES program information. DEQ has developed electronic systems so that NPDES-regulated entities can submit the required electronic DMRs and other reports to DEQ as the initial recipient. Instructions on how to access and use the appropriate electronic reporting tool can be found on DEQ’s website at <https://www.deq.ok.gov/water-quality-division/electronic-reporting/>. Assistance is also available by contacting DEQ at (405) 702-8100 or deqreporting@deq.ok.gov.

- b. A valid test for *Daphnia pulex* and/or Fathead minnows (excluding retests) at TX1 must be reported on the DMR for each reporting period specified in Part I of this permit, unless the

permittee is performing a TRE, which may increase the frequency of testing and reporting. An electronic DMR and a copy of the lab report must be received by the 15th day of the month following the end of the testing period.

If a test is determined to be invalid, the repeat test must be conducted in the coinciding testing period; if the first sample of the repeat test is taken after the last day of the final month in a testing period, the facility will be out of compliance with the reporting period. If a lethal failure is experienced for *Daphnia pulex* and/or Fathead minnows, 2 monthly WET retests are required during the two-month period following the month in which the test failure is experienced.

If more than one valid test (excluding retests) is performed on a species during a reporting period, the permittee shall report the lowest lethality LC₅₀ effluent concentrations for all such tests as the 7-day minimum on the DMR for the reporting period in question, specifying the dates of each test in the comments section of the DMR. Under no circumstance shall the monitoring/reporting period dates at the top of the DMR form be altered.

- c. If any test results in anomalous LC₅₀ findings (i.e., it indicates an interrupted dose response across the dilution series), DEQ recommends that the permittee contact the DEQ biomonitoring coordinator for a technical review of the test results prior to submitting the full laboratory test report and DMR. A summary of all tests initiated during the reporting period, including invalid tests, repeat tests, and retests, shall be attached to the reporting period DMR for DEQ review.

A test is a REPEAT test if it is performed as the result of a previously invalid test. A test is a RETEST if it is performed as the result of a previously failed test, the exception being where the test is the first (valid) test of a reporting period, in which case it is reported as such on the DMR for that period.

(1) The reporting period test summary attached to the DMR shall be organized as follows:

- (a) Invalid tests (basis for test invalidity must be described)
- (b) Valid tests (other than retests) initiated during current reporting period
- (c) Valid retests for tests failed during previous reporting period (if not submitted in the previous reporting period test summary)
- (d) Valid retests for tests failed during current reporting period

(2) The following information shall be listed in the reporting period test summary for each valid test in categories (b) through (d) in Item 4.b(1) above:

- (a) Test species
- (b) Date of test initiation at laboratory
- (c) Results of all concurrent effluent analyses specified in Part I of this permit
- (d) All test result parameters for the test species specified in Item 4.c below.

- d. The permittee shall report the following results for all VALID routine toxicity tests (excluding retests) on the DMR(s) for that reporting period in accordance with Item 4.b above and Part III of this permit.

Daphnia pulex

- (1) Parameter TIM3D: If the *Daphnia pulex* 48-hour LC₅₀ for survival is equal to or less than 100%, report a “1”; otherwise, report a “0”.
- (2) Parameter TAM3D: Report the *Daphnia pulex* 48-hour LC₅₀ value for survival.
- (3) Parameter TJM3D: Report the *Daphnia pulex* 48-hour percent mortality in the 100% effluent concentration.

Fathead Minnow

- (1) Parameter TIM6C: If the Fathead minnow 48-hour LC₅₀ for survival is equal to or less than 100%, report a “1”; otherwise, report a “0”.
 - (2) Parameter TAM6C: Report the Fathead minnow 48-hour LC₅₀ value for survival.
 - (3) Parameter TJM6C: Report the Fathead minnow 48-hour percent mortality in the 100% effluent concentration.
- e. The permittee shall report the following results for all VALID toxicity retests on the DMR(s) for that reporting period.
- (1) Retest #1 (STORET 22415): If the first monthly retest following failure of a routine test for *Daphnia pulex* and/or Fathead minnow results in a 48-hour LC₅₀ for survival equal to or less than 100%, report a “1”; otherwise, report a “0”.
 - (2) Retest #2 (STORET 22416): If the second monthly retest following failure of a routine test for *Daphnia pulex* and/or Fathead minnow results in a 48-hour LC₅₀ for survival equal to or less than 100%, report a “1”; otherwise, report a “0”.

Results of all retests shall be reported on a copy of the DMR for the reporting period (see Item 4.b above) in which the triggering routine test failure is experienced. Such retest results (using STORET codes 22415 and 22416 only) shall be received no later than the 15th day of the month at the end of the testing period for the retest. The full report for the retest (see Item 4.a above) shall be submitted along with the retest DMR. Even if a retest cannot be conducted before the end of the reporting period for which it is required (due to test initiation interval requirements), the retest results shall still be reported for the reporting period in which the triggering test failure is experienced. Under no circumstance shall the monitoring/reporting period dates for a supplemental retest DMR ever be modified. The permittee shall indicate the retest date in the comments section of the supplemental DMR and insert the date the DMR is submitted in the lower right hand corner. In this manner, both retests are reported for the same reporting period as the failed routine test triggering the retests. If retesting is not required during a given reporting period, the permittee shall leave the DMR retest fields blank.

5. Monitoring Frequency Reduction

- a. The permittee may apply for a testing frequency reduction upon the successful completion of the first year of testing for *Daphnia pulex* and/or Fathead minnow with no lethal effects demonstrated at or below the critical dilution. Certification in accordance with Item 5.b of this section shall be submitted with the application for monitoring frequency reduction. If granted, the monitoring frequency may be reduced to a minimum of once per 6 months (actual testing

must occur during the periods June 1 through September 30 and December 1 through March 31) for the approved test specie(s).

- b. Certification – The permittee must certify in writing that no lethal test failures have occurred for the species for which the monitoring frequency reduction is being requested and that all tests meet all test acceptability criteria in Item 3.a above. In addition, the permittee must provide a summary of all tests initiated during the period of certification including test initiation dates, species, test acceptability parameters, LC_{50} concentrations, percent mortality at the 100 percent effluent dilution, and coefficients of variation for the control and 100% effluent dilution. If the certification is approvable, DEQ will issue a letter of confirmation of the monitoring frequency reduction. A copy of the confirmation letter will be forwarded to DEQ's Permit Compliance Tracking Section to update the permit reporting requirements and TX1S will be activated while TX1Q will be deactivated. DEQ may refuse to approve the certification if it determines that, during the period for which the certification is submitted, there were errors in meeting test acceptability requirements, errors in statistical interpretation affecting test results reported on DMRs, late submissions of test reports or submissions of substantively incomplete test reports. If the certification is not approved, the permittee shall continue biomonitoring of the affected test species at a frequency of once per quarter until the permit is reissued.
- c. Lethal failures after a monitoring frequency reduction – If any lethal endpoint test is failed at any time after the granting of a monitoring frequency reduction, two monthly retests are required for that species in accordance with Item 2 above and the monitoring frequency for the affected test species shall be increased to the WET testing frequency prescribed in Part I before the frequency reduction was granted and shall remain for the life of the permit. TX1Q will be reactivated and TX1S will be discontinued for the life of the permit. If the permittee is performing a TRE this section does not apply.

6. Toxicity Reduction Evaluation (TRE)

- a. Within 90 days of confirming toxicity in the retests for a test species, the permittee shall submit to DEQ a TRE Action Plan and Schedule for conducting a Toxicity Reduction Evaluation (TRE). The TRE Action Plan shall specify the approach and methodology to be used in performing the TRE. A Toxicity Reduction Evaluation is an investigation intended to determine those actions necessary to achieve compliance with water quality-based effluent limits by reducing an effluent's toxicity to an acceptable level. A TRE is defined as a step-wise process which combines toxicity testing and analyses of the physical and chemical characteristics of a toxic effluent to identify the constituents causing effluent toxicity and/or treatment methods which will reduce the effluent toxicity. The TRE Action Plan shall lead to the successful elimination of effluent toxicity and include the following:
 - (1) Specific Activities: DEQ requires that a thorough audit of the design, operation and maintenance of the entire plant be done at the **outset** of the Toxicity Identification Evaluation (TIE) and/or TRE, rather than later in the process.

The plan shall detail the specific approach the permittee intends to utilize in conducting the TRE. The approach may include toxicity characterizations, identifications and confirmation activities, source evaluation, treatability studies, or alternative approaches. When the permittee conducts Toxicity Characterization Procedures, the permittee shall perform multiple characterizations and follow the procedures specified in the documents "Methods for Aquatic Toxicity Identification Evaluations: Phase I Toxicity Characterization Procedures" (EPA-600/6-91/003) and "Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I" (EPA-600/6-91/005F), or alternate procedures. When the permittee conducts Toxicity Identification Evaluations and Confirmations, the

permittee shall perform multiple identifications and follow the methods specified in the documents “Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity” (EPA/600/R-92/080) and “Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity” (EPA/600/R-92/081), as appropriate.

The documents referenced above may be available through the National Technical Information Service (NTIS)

1-(800) 490-9198

- (2) Sampling Plan (e.g., locations, methods, holding times, chain of custody, preservation, etc.): The effluent sample volume collected for all tests shall be adequate to perform the toxicity test, toxicity characterization, identification and confirmation procedures, and to conduct chemical specific analyses when a probable toxicant has been identified. Where the permittee has identified or suspects specific pollutant(s) and/or source(s) of effluent toxicity, the permittee shall conduct, concurrent with toxicity testing, chemical specific analyses for the identified and/or suspected pollutant(s) and/or source(s) of effluent toxicity. Where toxicity was demonstrated within 48 hours of test initiation, each composite sample shall be analyzed independently. Otherwise, the permittee may substitute a composite sample, comprised of equal portions of the individual composite samples, for the chemical specific analysis.
 - (3) Quality Assurance Plan (e.g., QA/QC implementation, corrective actions, etc.).
 - (4) Project Organization (e.g., project staff, project manager, consulting services, etc.).
- b. The permittee shall initiate the TRE Action Plan within 30 days of submitting the plan and schedule. The permittee shall assume all risks for failure to achieve the required toxicity reduction.
 - c. The permittee shall submit to DEQ a quarterly TRE Activities Report with the Discharge Monitoring Report (DMR) in months to be specified in their TRE plan, containing the following information:
 - (1) all data and/or substantiating documentation which identifies the pollutant(s) and/or source(s) of effluent toxicity;
 - (2) all studies/evaluations and results on the treatability of the facility’s effluent toxicity; and

- (3) all data which identifies effluent toxicity control mechanisms that will reduce effluent toxicity to the level necessary to meet no significant toxicity at any dilution.
- d. The permittee shall submit to DEQ a Final Report on Toxicity Reduction Evaluation Activities no later than 28 months after confirming toxicity in the retests. The final report shall provide information pertaining to the specific control mechanism(s) selected that will, when implemented, result in reduction of effluent toxicity to a 48-hour LC₅₀ effluent value of greater than 100 percent. The final report shall also provide a schedule for implementing the selected control mechanism(s).
- e. Quarterly testing during the TRE is the minimum monitoring requirement. DEQ recommends that permittees performing a TRE not rely on quarterly testing alone. Failure to identify the specific chemical compound(s) causing toxicity test failure will normally result in a permit limit for whole effluent toxicity per federal regulations at 40 CFR § 122.44(d)(1)(v).

F. CHRONIC WET TESTING REQUIREMENTS

1. Scope and Methodology

- a. The permittee shall test the effluent for toxicity in accordance with the provisions in this section, which apply individually and separately to the outfalls listed below. No samples or portions of samples from one outfall may be composited with samples or portions of samples from another outfall. The permittee shall bio-monitor for *Ceriodaphnia dubia* and *Pimephales promelas* (Fathead minnow) in accordance with the WET testing frequencies prescribed in Part I of the permit.

The permittee is encouraged to perform required biomonitoring activities as early in the reporting period as is practical to ensure sufficient time remains in the reporting period should retests/repeat tests be necessary.

All laboratory analyses for the biomonitoring parameters specified in this permit must be performed by a laboratory certified by DEQ for those parameters.

Provisions for performance-based monitoring frequency reductions are contained in Item 5 of this section.

Intervals between test initiation dates shall be a function of the required testing frequency, as follows:

- Monthly: No less than 20 days and no more than 40 days.
- Quarterly: No less than 2 months and no more than 4 months.
- Semi-annually: No less than 4 months and no more than 8 months.

APPLICABLE TO OUTFALL(S):	001
REPORTED ON DMR AS OUTFALL(S):	TX1
CRITICAL DILUTION:	100%
EFFLUENT DILUTION SERIES (ALL TESTS):	6.3%, 8.4%, 11.0%, 15.0% , 20.0%
SAMPLE TYPE:	Defined at Part I

TEST SPECIES/METHODS: 40 CFR Part 136, except for changes required by EPA, Region 6.

Ceriodaphnia dubia chronic static renewal 7-day survival and reproduction test, Method 1002.0, EPA-821-R02-013 (October 2002), or most recent update thereof. A minimum of 10 replicates consisting of a single organism each must be used in the control and in each effluent dilution of this test. This test should be terminated when 60 percent of the surviving females in the control produce 3 broods or at the end of 8 days, whichever comes first. If this criterion is not met at the end of 8 days, the test must be repeated.

Fathead minnow chronic static renewal 7-day larval survival and growth test, Method 1000.0, EPA-821-R-02-013 (October 2002), or most recent update thereof. A minimum of 5 replicates with 8 organisms per replicate must be used in the control and in each effluent dilution of this test.

- b. Chronic lethal effect test failure – The NOEC_L (No Observed Effect Concentration, Lethal) is defined as the greatest effluent dilution at and below which lethality (toxicity) that is statistically different from the control (0% effluent) at the 95 percent confidence level does not occur. Chronic lethal test failure (chronic NOEC_L test) is defined as a demonstration of a statistically significant lethal (toxic) effect at test completion to a test species at or below the critical dilution.
- c. Chronic sublethal effect test failure – The NOEC_S (No Observed Effect Concentration, Sublethal) is defined as the greatest effluent dilution at and below which sublethality (toxicity: inhibited reproduction in the *Ceriodaphnia dubia* test or inhibited growth in the Fathead minnow test) that is statistically different from the control (0% effluent) at the 95 percent confidence level does not occur. Chronic sublethal test failure (chronic NOEC_S test) is defined as a demonstration of a statistically significant sublethal effect at test completion to a test species at or below the critical dilution.
- d. Reopener clause – This permit may be reopened to require whole effluent toxicity limits, chemical specific effluent limits, additional testing, and/or other appropriate actions to address toxicity.

2. Testing Requirements due to Test Failure

Upon becoming aware of the failure of any test, the permittee shall immediately notify the DEQ Water Quality Division biomonitoring coordinator, and shall provide written notification within 5 working days, of the test failure with a summary of the results of, and any other pertinent circumstances associated with, the failed test.

- a. Whenever there is a test failure for *Ceriodaphnia dubia* and/or Fathead minnow during routine testing, the frequency of testing for *Ceriodaphnia dubia* and/or Fathead minnow shall automatically increase to, or continue at, as appropriate, the WET testing frequency prescribed in Part I for the remaining life of the permit. In addition, 2 additional monthly tests (retests) of *Ceriodaphnia dubia* and/or Fathead minnow are required. The 2 additional tests shall be conducted monthly during the next 2 consecutive months. The permittee shall not substitute either of the 2 additional tests for routine toxicity testing. A full laboratory report for the failed routine test and both additional tests, if required, shall be prepared and submitted to DEQ in accordance with procedures outlined in Item 4 of this section.

- b. Persistent toxicity – If either of the 2 additional tests results in an $NOEC_L$ and/or $NOEC_S$ value less than the critical dilution, persistent lethality and/or sublethality is exhibited. Then the permittee shall initiate a Toxicity Reduction Evaluation (TRE) as specified in Item 6 below. The TRE initiation date will be the test completion date of the first failed retest. The permittee may request a temporary exemption to this TRE-triggering criterion only if the permittee is under a compliance schedule defined in an OPDES permit or an enforcement order to effect aquatic toxicity reduction measures.
- c. Intermittent toxicity – If both additional tests result in an $NOEC_L$ and/or $NOEC_S$ value greater than or equal to the critical dilution, persistent lethality and/or sublethality is not exhibited. However, if any routine lethal and/or sublethal effect test failure occurs within 18 months of a prior lethal and/or sublethal effect test failure, intermittent lethality and/or sublethality is exhibited, and the permittee may be required by DEQ to initiate a TRE, as described in Item 6 below, based on the severity and pattern of such lethal and/or sublethal effect over time.
- d. Suspension of retesting requirements during a TRE – Retesting requirements in Item 2.a are temporarily suspended upon submittal of a TRE Action Plan. Such suspension of retesting requirements applies only to the species under evaluation by a TRE and only to the period during which a TRE is being performed.

3. Required Toxicity Testing Conditions

- a. Test acceptance – The permittee shall repeat a test, including the control and all effluent dilutions, if the procedures and quality assurance requirements defined in the test methods or in this permit are not satisfied, including the following additional criteria:
 - (1) The toxicity test control (0% effluent) must have survival equal to or greater than 80 percent.
 - (2) The mean number of *Ceriodaphnia dubia* neonates produced per surviving female in the control (0% effluent) must be 15 or more.
 - (3) Sixty percent of the surviving *Ceriodaphnia dubia* females in the control must produce 3 broods.
 - (4) The mean dry weight of surviving Fathead minnow larvae at the end of the 7 days in the control (0% effluent) must be 0.25 milligram per larva or greater.
 - (5) The percent coefficient of variation between replicates shall be 40 percent or less in the control (0% effluent) for the young of surviving females in the *Ceriodaphnia dubia* reproduction test and for the survival and growth endpoints of the Fathead minnow test.
 - (6) The percent coefficient of variation between replicates shall be 40 percent or less in the critical dilution, unless significant lethal or sublethal effects are exhibited for the young of surviving females in the *Ceriodaphnia dubia* reproduction test and for the growth and survival endpoints of the Fathead minnow test.
 - (7) As documented at test termination, no more than 40 percent of the *Ceriodaphnia dubia* test organisms in any replicate of any effluent dilution or in any replicate of the control (0% effluent) shall be male.

- (8) The Percent Minimum Significant Difference (PMSD) shall be in the range of 13 - 47 for *Ceriodaphnia dubia* reproduction. If the test PMSD is less than 13, 13 may be substituted for the PMSD.
- (9) The PMSD shall be in the range of 12 - 30 for Fathead minnow growth. If the test PMSD is less than 12, 12 may be substituted for the PMSD.

If the above criteria or criteria listed in Item 1.a are not met the test will be considered invalid. Test failure may not be construed or reported as invalid due to a coefficient of variation value for toxicity of greater than 40 percent for replicates tested at the critical dilution. A repeat test shall be conducted and the biomonitoring enforcement coordinator notified, within the reporting period of any test determined to be invalid.

- b. The permittee shall follow the requirements listed below in determining success or failure of a WET test:
 - (1) The statistical analyses in the *Ceriodaphnia dubia* survival test, used to determine if there is a significant difference between the control and the critical dilution shall be Fisher's Exact Test as described in EPA-821-R-02-013 or most recent update thereof.
 - (2) The statistical analyses in the *Ceriodaphnia dubia* reproduction test and the Fathead minnow larval survival and growth test, used to determine if there is a significant difference between the control and the critical dilution shall be in accordance with the methods for determining the No Observed Effect Concentration (NOEC) as described in EPA-821-R-02-013 or most recent update thereof.
 - (3) If the conditions of test acceptability are met in Item 3.a above and the percent survival of the test organism is equal to or greater than 80 percent in the critical dilution concentration and all lower dilution concentrations, the test shall be considered to be a passing test, and the permittee shall report an $NOEC_L$ of not less than the critical dilution for the DMR reporting requirements found in Item 4 below.
- c. The permittee shall use dilution water that meets the following standards:
 - (1) Dilution water used in the toxicity tests will be receiving water collected as close to the point of discharge as possible but unaffected by the discharge. In OAC 252:690-3-36, for discharges to a receiving stream classified as intermittent or to a receiving stream with no flow due to zero flow, the permittee shall substitute synthetic dilution water of similar pH, hardness and alkalinity to the closest downstream perennial water where the toxicity test is conducted. In the event that the receiving stream has sufficient flow for a sample to be collected, the facility will return to receiving stream water instead of synthetic.
 - (2) If the receiving water is unsatisfactory as a result of instream toxicity (fails to meet the test acceptance criteria in Item 3.a), the permittee must submit the test results exhibiting receiving water toxicity with the full test report required in Item 4 below and may thereafter substitute synthetic dilution water for the receiving water in all subsequent tests, provided the unacceptable receiving water test met the following stipulations:
 - (a) a synthetic dilution water control which fulfills the test acceptance requirements of Item 3.a was run concurrently with the receiving water control;
 - (b) the test indicating receiving water toxicity was carried out to completion (i.e., 48 hours);

- (c) the synthetic dilution water had a pH, hardness and alkalinity similar to that of the receiving water or closest downstream perennial water not adversely affected by the discharge, provided the magnitude of these parameters will not cause toxicity in the synthetic dilution water; and
 - (d) the receiving water test must be conducted at the start of each permitting cycle.
- d. The permittee shall collect samples that are representative of their effluent by following the criteria listed below:
- (1) Unless grab sampling is specifically authorized in Part I of the permit, the permittee shall collect 3 flow-weighted 24-hour composite samples representative of the flows during normal operation from the outfall(s) listed at Item 1.a above. If grab sampling is authorized, all requirements specified below for composite sampling also pertain to grab sampling. In such cases, collection of the grab sample is considered equivalent to collection of the last portion of a composite sample. Unless otherwise specified in Part I of the permit, a 24-hour composite sample consists of a minimum of 12 effluent portions collected at equal time intervals representative of a 24-hour operating day and combined proportional to flow or a sample continuously collected proportional to flow over a 24-hour operating day.
 - (2) The first composite sample shall be used to initiate each test. The permittee must initiate the toxicity test within 36 hours after the collection of the last portion of the first composite sample. Collection of the second and third composite samples must be timed so as to permit an approximately equal use distribution of the three composite samples for daily static renewals. The permittee must collect the composite samples so that the maximum holding time for any effluent sample shall not exceed 72 hours. Samples shall be chilled to maintain a temperature at or below 6° C but not frozen during collection, shipping, and/or storage.
 - (3) The permittee must collect the composite samples such that the effluent samples are representative of any periodic episode of chlorination, biocide usage or other potentially toxic substance discharged on an intermittent basis.
 - (4) If it is anticipated that flow from the outfall being tested may cease prior to collection of the third composite sample, the permittee must ensure that the second composite sample is of sufficient volume to complete the required testing with daily renewal of effluent. The abbreviated composite sample collection duration, the static renewal protocol associated with an abbreviated sample collection, and a summary of the circumstances justifying collection of an abbreviated sample must be adequately documented in the full test report required in Item 4 below. DEQ reserves the right to require a retest and/or consider the permittee in violation of this permit if the basis offered for justification of an abbreviated sample is insufficient, flawed, or in any way reflects an effort on the part of the permittee to avoid test failure by use of an abbreviated sample.

4. Reporting

- a. The permittee shall retain each full report pursuant to the records retention provisions of Part III of this permit. The permittee shall also submit to the DEQ biomonitoring enforcement coordinator a copy of the full laboratory test reports at TX1 in accordance with the Report Preparation Section of EPA-821-R-02-013 for every valid or invalid toxicity test initiated, whether carried to completion or not, including any test which is considered invalid, is terminated early for any reason, or which indicates receiving water toxicity. The reports shall be received no later than the 15th day of the month following the end of the testing period.

As of October 22, 2015, the EPA published the “NPDES Electronic Reporting” final rule, with an effective date of December 21, 2015, which requires the electronic reporting and sharing of NPDES program information. DEQ has developed electronic systems so that NPDES-regulated entities can submit the required electronic DMRs and other reports to DEQ as the initial recipient. Instructions on how to access and use the appropriate electronic reporting tool can be found on DEQ’s website at <https://www.deq.ok.gov/water-quality-division/electronic-reporting/>. Assistance is also available by contacting DEQ at (405) 702-8100 or deqreporting@deq.ok.gov.

- b. A valid test for *Ceriodaphnia dubia*/Fathead minnow (excluding retests) at TX1 must be reported on the DMR for each reporting period specified in Part I of this permit unless the permittee is performing a TRE, which may increase the frequency of testing and reporting. An electronic DMR and a copy of the lab report must be received by the 15th day of the month following the end of the testing period.

If a test is determined to be invalid, the repeat test must be conducted in the coinciding quarter; if the first sample of the repeat test is taken after the last day of the final month in a testing period, the facility will be out of compliance with the reporting period. If a lethal and/or sublethal test failure is experienced for *Ceriodaphnia dubia*/Fathead minnow, 2 monthly WET retests are required during the 2-month period following the month in which the test failure is experienced.

If more than one valid test (excluding retests) is performed on a species during a reporting period, the permittee shall report the lowest lethality and sublethality NOEC effluent concentrations for all such tests as the 7-day minimum on the DMR for the reporting period in question, specifying the dates of each test in the comments section of the DMR. Under no circumstance shall the monitoring/reporting period dates at the top of the DMR form be altered.

- c. If any test results in anomalous NOEC_L or NOEC_S finding (i.e., it indicates an interrupted dose response across the dilution series), DEQ recommends that the permittee contact the DEQ biomonitoring coordinator for a technical review of the test results prior to submitting the full laboratory test report and DMR. A summary of all tests initiated during the reporting period, including invalid tests, repeat tests, and retests, shall be attached to the reporting period DMR for DEQ review.

A test is a REPEAT test if it is performed as the result of a previously invalid test. A test is a RETEST if it is performed as the result of a previously failed test, the exception being where the test is the first (valid) test of a reporting period, in which case it is reported as such on the DMR for that period.

- (1) The reporting period test summary attached to the DMR shall be organized as follows:
 - (a) Invalid tests (basis for test invalidity must be described)
 - (b) Valid tests (other than retests) initiated during current reporting period
 - (c) Valid retests for tests failed during previous reporting period (if not submitted in the previous reporting period test summary)
 - (d) Valid retests for tests failed during current reporting period
- (2) The following information shall be listed in the reporting period test summary for each valid test in categories (b) through (d) in Item 4.b(1) above:
 - (a) Test species

- (b) Date of test initiation at laboratory
 - (c) Results of all concurrent effluent analyses specified in Part I of this permit
 - (d) All test result parameters for the test species specified in Item 4.c below.
- d. The permittee shall report the following results for all VALID toxicity tests (excluding retests) on the DMR(s) for that reporting period in accordance with Item 4.b above and Part III of this permit.

Ceriodaphnia dubia

- (1) Parameter TLP3B: If the *Ceriodaphnia dubia* NOEC_L for survival is less than the critical dilution, report a “1”; otherwise, report a “0”.
- (2) Parameter TOP3B: Report the *Ceriodaphnia dubia* NOEC_L value for survival.
- (3) Parameter TJP3B: Report the *Ceriodaphnia dubia* percent mortality in the critical dilution at test completion.
- (4) Parameter TGP3B: If the *Ceriodaphnia dubia* NOEC_S for reproduction is less than the critical dilution, report a “1”; otherwise, report a “0”.
- (5) Parameter TPP3B: Report the *Ceriodaphnia dubia* NOEC_S value for reproduction.
- (6) Parameter TQP3B: Report the highest coefficient of variation (critical dilution or control) for *Ceriodaphnia dubia* reproduction.

Fathead Minnow

- (1) Parameter TLP6C: If the Fathead minnow NOEC_L for survival is less than the critical dilution, report a “1”; otherwise, report a “0”.
 - (2) Parameter TOP6C: Report the Fathead minnow NOEC_L value for survival.
 - (3) Parameter TJP6C: Report the Fathead minnow percent mortality in the critical dilution at test completion.
 - (4) Parameter TGP6C: If the Fathead minnow NOEC_S for growth is less than the critical dilution, report a “1”; otherwise, report a “0”.
 - (5) Parameter TPP6C: Report the Fathead minnow NOEC_S value for growth.
 - (6) Parameter TQP6C: Report the highest coefficient of variation (critical dilution or control) for Fathead minnow survival and growth.
- e. The permittee shall report the following results for all VALID toxicity retests on the DMR(s) for that reporting period.
- (1) Retest #1 (STORET 22415): If the first monthly retest following failure of a routine test for *Ceriodaphnia dubia*/Fathead minnow results in an NOEC_L and/or NOEC_S less than the critical dilution, report a “1”; otherwise, report a “0”.

- (2) Retest #2 (STORET 22416): If the second monthly retest following failure of a routine test for *Ceriodaphnia dubia*/ Fathead minnow results in an NOEC_L and/or NOEC_S less than the critical dilution, report a “1”; otherwise, report a “0”.

Results of all retests shall be reported on a copy of the DMR for the reporting period (see Item 4.b above) in which the triggering routine test failure is experienced. Such retest results (using STORET codes 22415 and 22416 only) shall be received no later than the 15th day of the month at the end of the testing period for the retest. The full report for the retest (see Item 4.a above) shall be submitted along with the retest DMR. Even if a retest cannot be conducted before the end of the reporting period for which it is required (due to test initiation interval requirements), the retest results shall still be reported for the reporting period in which the triggering test failure is experienced. Under no circumstance shall the monitoring/reporting period dates for a supplemental retest DMR ever be modified. The permittee shall indicate the retest date in the comments section of the supplemental DMR and insert the date the DMR is submitted in the lower right hand corner. In this manner, both retests are reported for the same reporting period as the failed routine test triggering the retests. If retesting is not required during a given reporting period, the permittee shall leave the DMR retest fields blank.

5. Monitoring Frequency Reduction

- a. The permittee may apply for a testing frequency reduction upon the successful completion of the first year of testing for *Ceriodaphnia dubia* and/or Fathead minnow with no lethal or sublethal effects demonstrated at or below the critical dilution. Certification in accordance with Item 5.b of this section shall be submitted with the application for monitoring frequency reduction. If granted, the monitoring frequency may be reduced to a minimum of once per 6 months (actual testing must occur during the periods June 1 through September 30 and December 1 through March 31) for the approved test specie(s).
- b. Certification – The permittee must certify in writing that no lethal or sublethal test failures have occurred for the species for which the monitoring frequency reduction is being requested and that all tests meet all test acceptability criteria in Item 3.a above. In addition, the permittee must provide a summary of all tests initiated during the period of certification including test initiation dates, species, test acceptability parameters, NOEC_L values percent mortality at the critical dilution, NOEC_S values, and coefficients of variation for the control and critical dilutions. If the certification is approvable, DEQ will issue a letter of confirmation of the monitoring frequency reduction. A copy of the confirmation letter will be forwarded to DEQ’s Permit Compliance Tracking Section to update the permit reporting requirements and TX1S will be activated while TX1Q will be deactivated. DEQ may refuse to approve the certification if it determines that, during the period for which the certification is submitted, there were errors in meeting test acceptability requirements, errors in statistical interpretation affecting test results reported on DMRs, late submissions of test reports or submissions of substantively incomplete test reports. If the certification is not approved, the permittee shall continue biomonitoring of the affected test species at a frequency of once per quarter until the permit is reissued.
- c. Lethal and/or sublethal failures after a monitoring frequency reduction – If any lethal or sublethal endpoint test is failed at any time after the granting of a monitoring frequency reduction, two monthly retests are required for that species in accordance with Item 2 above and the monitoring frequency for the affected test species shall be increased to the WET testing frequency prescribed in Part I before the frequency reduction was granted and shall remain for the life of the permit. TX1Q will be reactivated and TX1S will be discontinued for the life of the permit. If the permittee is performing a TRE this section does not apply.

6. Toxicity Reduction Evaluation (TRE)

- a. Within 90 days of confirming toxicity in the retests for a test species, the permittee shall submit to DEQ a TRE Action Plan and Schedule for conducting a Toxicity Reduction Evaluation (TRE). The TRE Action Plan shall specify the approach and methodology to be used in performing the TRE. A Toxicity Reduction Evaluation is an investigation intended to determine those actions necessary to achieve compliance with water quality-based effluent limits by reducing an effluent's toxicity to an acceptable level. A TRE is defined as a step-wise process which combines toxicity testing and analyses of the physical and chemical characteristics of a toxic effluent to identify the constituents causing effluent toxicity and/or treatment methods which will reduce the effluent toxicity. The TRE Action Plan shall lead to the successful elimination of effluent toxicity and include the following:

- (1) Specific Activities: DEQ requires that a thorough audit of the design, operation and maintenance of the entire plant be done at the **outset** of the Toxicity Identification Evaluation (TIE) and/or TRE, rather than later in the process.

The plan shall detail the specific approach the permittee intends to utilize in conducting the TRE. The approach may include toxicity characterizations, identifications and confirmation activities, source evaluation, treatability studies, or alternative approaches. When the permittee conducts Toxicity Characterization Procedures, the permittee shall perform multiple characterizations and follow the procedures specified in the documents "Methods for Aquatic Toxicity Identification Evaluations: Phase I Toxicity Characterization Procedures" (EPA-600/6-91/003) and "Toxicity Identification Evaluation: Characterization of Chronically Toxic Effluents, Phase I" (EPA-600/6-91/005F), or alternate procedures. When the permittee conducts Toxicity Identification Evaluations and Confirmations, the permittee shall perform multiple identifications and follow the methods specified in the documents "Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity" (EPA/600/R-92/080) and "Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity" (EPA/600/R-92/081), as appropriate.

Cincinnati, Ohio 45242-0419
E-mail: nscep@bps-lmit.com
1-(800) 490-9198

- (2) Sampling Plan (e.g., locations, methods, holding times, chain of custody, preservation, etc.): The effluent sample volume collected for all tests shall be adequate to perform the toxicity test, toxicity characterization, identification and confirmation procedures, and to conduct

chemical specific analyses when a probable toxicant has been identified. Where the permittee has identified or suspects specific pollutant(s) and/or source(s) of effluent toxicity, the permittee shall conduct, concurrent with toxicity testing, chemical specific analyses for the identified and/or suspected pollutant(s) and/or source(s) of effluent toxicity. Where toxicity was demonstrated within 48 hours of test initiation, each composite sample shall be analyzed independently. Otherwise, the permittee may substitute a composite sample, comprised of equal portions of the individual composite samples, for the chemical specific analysis.

- (3) Quality Assurance Plan (e.g., QA/QC implementation, corrective actions, etc.).
 - (4) Project Organization (e.g., project staff, project manager, consulting services, etc.).
- b. The permittee shall initiate the TRE Action Plan within 30 days of submitting the plan and schedule. The permittee shall assume all risks for failure to achieve the required toxicity reduction.
 - c. The permittee shall submit to DEQ a quarterly TRE Activities Report with the Discharge Monitoring Report in months to be specified in their TRE plan, containing the following information:
 - (1) all data and/or substantiating documentation which identifies the pollutant(s) and/or source(s) of effluent toxicity;
 - (2) all studies/evaluations and results on the treatability of the facility's effluent toxicity; and
 - (3) all data which identifies effluent toxicity control mechanisms that will reduce effluent toxicity to the level necessary to meet no significant toxicity at any dilution.
 - d. The permittee shall submit to DEQ a Final Report on Toxicity Reduction Evaluation Activities no later than 28 months after confirming lethality and/or sublethality in the retests. The final report shall provide information pertaining to the specific control mechanism(s) selected that will, when implemented, result in reduction of effluent toxicity to the level at which there is no significant lethality and/or sublethality at the critical dilution. The final report shall also provide a schedule for implementing the selected control mechanism(s).
 - e. Quarterly testing during the TRE is the minimum monitoring requirement. DEQ recommends that permittees performing a TRE not rely on quarterly testing alone. Failure to identify the specific chemical compound(s) causing toxicity test failure will normally result in a permit limit for whole effluent toxicity per federal regulations at 40 CFR § 122.44(d)(1)(v).
